Subject: Big array
Posted by xqinshan on Mon, 04 Feb 2013 13:39:42 GMT

Hi, I download a netcdf file and NCDF_VARGET a big array A into my program. When I calculate it as A=scale*A, a message comes out: Array has too many elements.
I cannot do anything with the data. How to handle this problem? By the way, are there any IDL statements to swap out workspace like 'clear' in Matlab?

Best
