
Subject: Plot continuous line when have missing data points

Hello,

I'm trying to plot temperature profiles and am having a hard time because I have gaps of temperature data at certain altitudes. For example...

alt = [1833.68, NaN, 2443.28] and temp = [298.150, NaN, 291.650]. Because I'm trying to see the vertical profile I still want a solid line between these points even though there's a gap of data. I will see the gap by where the symbols are. Is there a way to do this or do I have to create a new array with continuous data points to get a line plotted? I've searched to see if anyone else has already asked this question but it seems like people want to leave gaps in the data their plotting if I'm reading the posts correctly.

Thanks for your help.
