David, it turns out that you were right on multiple levels: there was some code that I didn't show and actually created the problem, right after the plot:

```
XYOUTS, p[0]+0.13, p[3]-0.08, vel, charthick=1.,charsize=2, Font = -1, /normal, color =  
cgColor('white')
```

I suppose that the way I chose the color messes up something. There is a solution specific to this problem? I mean, other than doing what you already suggested above - which works - can I just chose the color in another way that doesn't create the problem?

Thanks in advance.
