An exponent has higher precedence than negation. So

```
IDL> print,(-0.5)^0.5  
-NaN
```

% Program caused arithmetic error: Floating illegal operand

i.e. you can't take the square root of a negative number, but

```
IDL> print,-0.5^0.5  
-0.707107
```

says to negate the result of $0.5^{0.5}$
