oops I meant "array and scalar variables" above...

to make one other point, the ISA(/ARRAY) function is unambiguous in its meaning.. it should return true for arrays and false for scalars, regardless of whether the scalar is an object reference.

unless.. of course, the object reference refers to an array-like object I suppose... but in the case of hash objects if you try to do this:

```
a=hash('first',1)
```

and then try to index it with a[0], this throws an error.

confusion! :)
