>> Guys, I'm happy to share with you good news -- the problem is solved! The latexify advice works. I modified slightly the latexify(again had problems with cyrillic in LaTeX :D) and now I can eventually print Russian text. Mats, you saved me from writing boring translator code and more importantly I can use device font which I usually prefer. I love this group!

I find it very useful (not only for the language issue), you just will need to make few changes to define nice appearance on a page, possibility to add text and so on.

Best,  
Katya
