I downloaded and started experimenting with Michael Galloy's MGLIB
library yesterday, and I was impressed with some of the features. I
wanted to give a heads-up to the list that this is out there, and
contains a lot of useful tools. Not as extensively documented as
David Fanning's library, but it looks quite powerful.

In particular, the library routines for interacting with HDF5 files
are very nice. It looks like there are a lot of visualization tools
as well. Also routines for interfacing with Google Chart tools, and
with Google Voice as well ?!?

have a look:
