> It kind of depends on what OS and what version of IDL you are using. On the Mac, CURSOR has a "cursed" history of stopping working and then being fixed, and then stopping working again. This has happened several times through the IDL 7 and IDL 8 release cycles. The symptoms are what you describe: CURSOR just pauses and doesn't do anything, doesn't respond to clicks. Also, on X11 I have to disable the "Click through to inactive windows" setting.
