David,

I am using GSview 5.0 to view my .ps. files.

A little while ago I was fiddling with the lines for my vertical line markers, copy-pasting those lines over, deleting the old ones, doing a retall, then saving, recompiling, and re-running. Somehow, some of the lines would magically become the right thickness. Then I'd try implementing the same change process for all 4 of them, and all of a sudden some would revert back to being grey or the wrong thickness again. I just tried setting the thickness to an integer value of 1, and now I have three lines of what appears to be correct thickness and color, yet one of them is still grey and too thick.

Gremlins, I tell you....gremlins.

It works, however, some of the lines appear grey and of greater thickness, with the exception of the bluest (left most) line. That one looks correct, thinner and black, despite it NOT being plotted first.

> First, I tried using TVLCT (following your article on "Understanding IDL colors") to specify the RGB values for black and using the THICK keyword to specify thickness. This did not work. The left most line is still black and correct thickness, the others are greyish and thicker. Second thing I tried was to amend the VLINE routine to call cgOPlot instead of regular OPlot, and then called the colors in using the string name. Still doesn't work.
