
Subject: Bug? Hash and System Variable

The following simple code errors out

```
defsv, '!SOME_SYS_VAR', hash()
help, !SOME_SYS_VAR
(!SOME_SYS_VAR)['A'] = 1
end
```

The output is as follows

```
<Expression> HASH <ID=1 NELEMENTS=0>
% Expression must be an array in this context: !SOME_SYS_VAR.
```

The funny thing is that I can actually run the same command by typing it on the IDL prompt. So following command runs:

```
IDL> (!SOME_SYS_VAR)['A'] = 1
IDL> print, !SOME_SYS_VAR
A: 1
```

Is it a bug or feature? And how can I correct the code so it can run inside a routine instead of on the prompt (@ is the same as typing on the prompt).

Thanks!
