In article <331B37EE.41C6@irc.chmcc.org>, williams@irc.chmcc.org says...

```
>
> I know that I can find the union of two arrays by doing something like
>
> temp = [array1, array2]
> union = temp(uniq(temp, sort(temp)))
>
> But how would I go about finding the intersection of the two arrays?
> i.e. Is there a nice vector way of doing it rather than brute force?
> (aka: Which IDL function did I miss this time?)
>
> Thanks in advance,

```

The attached routine (WHERE_ARRAY.PRO) was posted a few years back on this newsgroup, courtesy of Stephen Strebel. It uses a vector algorithm, and does what I think Phil wants to do.

Good luck!

Dave

;

```

;+
; NAME:
; WHERE_ARRAY
;
; PURPOSE:
; Return the indices where vector B exists in vector A.
; Basically a WHERE(B EQ A) where B and A are 1 dimensional arrays.
;
; CATEGORY:
;   Array
;
; CALLING SEQUENCE:
; result = WHERE_ARRAY(A,B)
;
; INPUTS:
; A vector that might contains elements of vector B
; B vector that we would like to know which of its
; elements exist in A
;
; OPTIONAL INPUTS:
;
; KEYWORD PARAMETERS:
; iA_in_B return instead the indices of A that are in
; (exist) in B
;
; OUTPUTS:
; Index into B of elements found in vector A. If no
; matches are found -1 is returned. If the function is called
; with incorrect arguments, a warning is displayed, and -2 is
; returned (see SIDE EFFECTS for more info)
;
; OPTIONAL OUTPUTS:
;
; COMMON BLOCKS:
; None
;
; SIDE EFFECTS:
; If the function is called incorrectly, a message is displayed
; to the screen, and the !ERR_STRING is set to the warning
; message. No error code is set, because the program returns
; -2 already
;
; RESTRICTIONS:
; This should be used with only Vectors. Matrices other than
; vectors will result in -2 being returned. Also, A and B must
; be defined, and must not be strings!
;
; PROCEDURE:

```

```

;
;
; EXAMPLE:
; IDL> A=[2,1,3,5,3,8,2,5]
; IDL> B=[3,4,2,8,7,8]
; IDL> result = where_array(a,b)
; IDL> print,result
;      0      0      2      2      3      5
;
; SEE ALSO:
; where
;
;
; MODIFICATION HISTORY:
; Written by: Dan Carr at RSI (command line version) 2/6/94
; Stephen Strebel 3/6/94
; made into a function, but really DAN did all
; the thinking on this one!
; Stephen Strebel 6/6/94
; Changed method, because died with Strings (etc)
; Used ideas from Dave Landers. Fast TOO!
; Strebel 30/7/94
; fixed checking structure check
;-
FUNCTION where_array,A,B,IA_IN_B=ia_in_B

; Check for: correct number of parameters
; that A and B have each only 1 dimension
; that A and B are defined
