Subject: type conversion error - help needed urgent
Posted by sid on Sun, 26 May 2013 18:05:24 GMT

Hello everyone,
        My variable is like this jplm5(4)=3456.
Since it is a huge number of files I would like to put this in a loop
So I did like this
res(2,w)='jplm'+strtrim(v,2)+dpi(0)
where v =10; this also changes thats why i need a loop in this also
then it gives error like unable to convert string to integer
then I did
res(2,w)='jplm'+strtrim(v,2)+string(dpi(0))
then if I print this alone
print, 'jplm'+strtrim(v,2)+string(dpi(0))
jplm10 34;it prints like this
Then I did
print, 'jplm'+strtrim(v,2)+'('+string(dpi(0))+')'
jplm10(34);it prints like this now

but actually what i need is the value of this below,
jplm10(34)
I need to use this value for further calculations but this is taken as a string and the variable couldnt
be used.

Please let me know how to take this as a variable without this type conversion error.

thanking you in advance
sid
