Hello Everyone !

I use IDL 8.2 and my problem is the following :

I have a FITS Image that i know how to read. I choose 2 points and read the pixel value along the line between them.

My problem is, i want to do the same (i.e read the pixel value) but along a surface , (the same line but with some pixel wide)

I thought of using interpol, and add several one but it seems to be very long.

Any ideas ?

thanks !
