Hello,

I've been trying to create my own color table and have successfully created and saved it with a new name. It was exactly what I wanted though so I change some of the colors around and resaved it. Unfortunately now I have two color tables listed in xloadct named exactly the same. How do I delete one of the saved color tables? And if I want to modify the one that is already created, how do I go about doing that without saving a duplicate? Thank you
