
Subject: A possible bug in IDL 8.2.3

I don't know whether this is a bug or not, but the behaviour of the following two lines is not what I expected

```
IDL> a=plot([0,1,3],yrange=[0,3])
IDL> b = plot([-1,1,2],/overplot, 'g')
```

The line of b will go outside the plotting box, because it tried to get to -1, but the yrange is limited to be [0,3] by a.

Here is my IDL version:

```
{ x86_64 darwin unix Mac OS X 8.2.3 May  2 2013    64    64 }
```

Please let me know whether there is anything I can do about it.

Thanks,

Xin
