I will try to find out, but it is like fighting with eyes closed against a giant.

Just for the sake of it.
I tried the same code on my laptop and got the thing running. Apart from this obvious difference in results, on my laptop I get the line
% Loaded DLM: XML.
This I don't get on my desktop.

Any idea how I can recover this? idl_xml.dll? What to do with it?

Cheers,
Helder
