Subject: Multiple plots with plot function

I'm not able to figure out how to replicate !p.multi functionality with the PLOT function. I create a plot with:

```
IDL> pt = PLOT(FINDGEN(10),LAYOUT=[1,2,1])
```

which creates a window with room for two plots, and places this first plot at the top. Is there not a simple way to have a plot go to position "2" in this window? The only thing I can find is manual fiddling with the POSITION keyword. This seems horribly awkward. I hope I'm missing something easy.
