Subject: A bug of NG plot? Posted by Xin Tao on Thu, 15 Aug 2013 05:48:18 GMT

Hello,

The following code can produce some very messy figure from NG plot.

IDL> print, !version { x86_64 darwin unix Mac OS X 8.2.3 May 2 2013 64 64}

IDL> g=dblarr(10)*0.0+5.0IDL> ga=g+1e-14*double(randomu(-10,10)) IDL> a=plot(ga)

The size of chars is just not right. I don't know whether it's my problem or it's a bug of IDL. Could someone please let me know how to fix this?

Thanks,

Xin
