Hello,

The following code can produce some very messy figure from NG plot.

```
IDL> print, !version
```

```
{ x86_64 darwin unix Mac OS X 8.2.3 May  2 2013    64    64}
```

```
IDL> g=dblarr(10)*0.0+5.0
```

```
IDL> ga=g+1e-14*double(randomu(-10,10))
```

```
IDL> a=plot(ga)
```

The size of chars is just not right. I don't know whether it's my problem or it's a bug of IDL. Could someone please let me know how to fix this?

Thanks,

Xin
