By the way:

If I work with Wave Widgets, is there any method to check if
a widget id is legal?

If U try to wtset some non-existant widget, wave crashes immedietly.
(Wave 5.0 on SGI Indy, IRIX 5.3)

example:

```
WAVE> print,wtclose(1234)
Segmentation fault (core dumped)
trick%
```

Thanks for any hint...

Andre
