I also don't seem to have an IDL start-up file. Unfortunately, I work in one of those offices where the sysadmins control a lot of things. They built a script that runs when you type "idl" that sets up the environment depending on what OS you're using. When I manage to put my library directory into the path, the default "path" (includes dozens of directories) gets lost. I thought I had it appending before, but haven't been able to duplicate for the rest of the afternoon.
