Hello,

I don't use the workbench. IMO it's just trading in a bunch of exposed problems for others under a (generally) locked hood. But don't let my bias stop you from giving it a go. You may really like/prefer it.

Getting back to your issue:

I'm not a CSH person, but the syntax you listed,

```
setenv IDL_PATH"$HOME/shdom/idl"
```

doesn't look right. Should it be:

```
setenv IDL_PATH "${IDL_PATH}:+\${HOME}/shdom/idl"
```

?

You want to make sure you prepend (or append) the IDL_PATH to itself.

Also, DavidF's comment about the order may be an issue. I take great pains to **not** have similarly named routines in different directories. But if you do have several versions of the same routines, not specifying a specific order may cause problems. I would recommend fixing that by having only one version of everything, but that may not be a workable/quick solution.

cheers,

paulv

p.s. Nothing wrong with being a Fortran programmer. That's what I am. Fortran2003 all the way! :o)
