Hi all,

I have a 2D array (mountain elevation) and an image (trees,rocks,...) corresponding ot it. I need to overlap the image on the elevation information, along with the axis information and the capability of moving it around by the mouse in 3D.

Cgsurface (coyote's magic) seems to work well, however, I can't do anything with the mouse, nor rotating the axes from within the code (strange why this is not allowed). I am running a IDL 7.1, XQuarts 7.2.4, and already tried few terminal command remedies with no success fixing the cursor issue.

I see that xobjview works fine for my problem, however: no axis appear on the plot and th eimage is always in grey color!

Is there any know way to fix any of these problems? A third solution would be fine, too.

Please advise-thanks a lot for you help,
Steve
