Subject: color table

Does anyone know why the system variable !d.table_size is changing ?
Is !d.table_size machine-dependent?

I have my own color table which includes 235 colors. When I need color
image, I load it in. It has been working fine until yesterday when I
found only first 90 color were loaded. It took me a while to figure out
that !d.table_size was changed from 256 to 90. After I exited and
re-ran IDL several time, I found !d.table_size was changing although it
was 256 in most cases.

Thanks in advance.
