Subject: Extracting plot boundaries
Posted by Beau Bellamy on Mon, 30 Sep 2013 08:12:49 GMT

This is just a question regarding aesthetics.
I am plotting some time series data and i am adding labels for sections of the data that are related to when the data was collected. I want to make it so the labels are always in the same place relative to the boundaries (mostly the top). I am currently using yrange to set the boundaries, but IDL is optimizing the space somehow and the value i set isn't the top boundary of the plot. Is there a way to extract the top boundary, i.e. max Y value, of a plot?
