Just to sound even more stupid now I got this error message:

% HASTROM: ERROR - No overlap found between original and reference
images
% HASTROM: Be sure you have the right headers and the right equinoxes
% Compiled module: WRITEFITS.

   The Galactic coordinates of the cloud are the same. On ds9 I put
the cursor at the centre of the cloud and on both cases the galactic
latitude and longitude are the same. What is my mistake though?

I think you should check both headers in files. probably they are not in same regions. because
hastrom aligns images so if there is no overlap between maps you cannot use it.

you can try frebin or congrid. they might help
