Hello everyone,

My question is about dealing with multiple size of image before any operation.  
I have several .fits file of different size : 1050x800, 525x400 mainly.  
i use file\_search to list the different names and create an empty array  
(1050,800,n-elements(filelist)).  
My problem is with the smaller array, he refuses to write it due to the different size.  
Is there a way to trick IDL to write 0 instead of nothing for the smaller images ?

Thank your for your time :)
