Now I have a widget application developed using the normal non-OO widget, i.e. the top level base is created using WIDGET_BASE. And I want to improve it using the objected widgets in catalyst library. But the time is limited. Now I just have time to change the image view part of the system. So How can I combine the WIDGET_BASE and BASEWIDGET object into the same application.

I have tried to set a widget_base as the parent to a BASEWIDGET objects. But I have no idea how to do it.

Please help...

Jie
