Subject: The include @ command

Hi,

I am using in several of my routines an include for some special
code.
I do this to pass more than 65 variables which is the limit for
a normal procedure with named variables.

The include sign '@' with the source must be the first sign
in the row where it should be used. Why?

Sometimes if I use the same include option twice I got an error
meaning program code area full.
What did this really mean?
