Has any one had issues with permissions using IDL/ENVI on Mavericks? I get a warning message "Alternate Header Direcotry: /Applications/exelis/idl82/lib/hook Problem: Unable to write to this directory" on ENVI startup, though it is clearly not a fatal error.

Thinking it was a mangled permissions issues from building the system from Time Machine (new computer with Mavericks, so used Time Machine to install all the previous system's software), but even after uninstalling ENVI and IDL and rebuilding cleanly from the installer, I get the same error message.

Running IDL 8.2.3/ENVI 5.0SP3 on Mavericks. Otherwise seems to work fine.
