David,

From gshhs.c file we have:

```
line = (h.area) ? 0 : 1; /* Either Polygon (0) or Line (1) (if no area) */  
if (version  $\geq 9$ ) { /* Variable magnitude for area scale */  
    m = h.flag  $\gg 26$ ;  
    scale = pow (10.0, (double)m); /* Area scale */  
}  
area = h.area / scale; /* Now im  $\text{km}^2$  */  
f_area = h.area_full / scale; /* Now im  $\text{km}^2$  */
```

so, in the cgmap_gshhs.pro
we should have something like:
`magnitude = 10.0 ^ (- ISHFT(f, -26))` for version ≥ 9
and
`magnitude = 0.1` for version < 9

and
`polygonArea = header.area * magnitude`

in order to produce the correct results for the polygon area
