Hi Mats Löfdahl, thanks for your interest!  
my problem is that my "Im" is a 3D matrix in which every pixel is a curve with 60 elements. Inner loop is for these ones: it does the fitting after the exponential curve inversion. I must follow a scholastic approach that tests all of 60 inversion time T0 within inner loop. I should try a smarter way to find the best inversion time T0.  
Cheers, Christina
