1. In a widget application that worked fine on Snow Leopard, I now get this error

% X windows protocol error: GLXBadContext.

2. If I drag the widget from my laptop screen to my secondary monitor, it disappears entirely.

I can get around this by going into the "all desktops" view and dragging the widget application from one desktop to the other.

3. The widget window seems to be able to exist in only the bottom 2/3 of my screen.

I am using IDL 8.0 and everything worked fine in Snow Leopard. Just updated this morning...
