Hello everyone,
        I have data set of 800 data points spreaded in 20 years, I have to take six monthly mean
of the data set, but I need to take weighted mean. My preference is that , while taking six monthly
mean more weightage has to be given to those values which are more in numbers, less
weightage to those values which lesser in numbers. How can I do this, is there any idl routine that
does this. Please help me out in this regard.
thanking you in advance
