Hi Chris,

IDL Version 8.3 (linux x86_64 m64). (c) 2013, Exelis Visual Information Solutions, Inc.

% Compiled module: BUILD_BRIDGES.

% Loaded DLM: IDL_IDLBRIDGE.

% IDL_IDLBRIDGE Error: WINDOW: Unable to open X Windows display.

Is your DISPLAY environment variable set correctly?

It does require X-Window.

any comments?

by the way, I used the trick from Mario - it is appeared that I really started the background
calculations, BUT all bridges used the same CPU.

it was about 9% load for each of 10 jobs.

The same task uses 10x100% when X-Window is there.

Thanks,

Boris.
