Hi Matthew - I also installed both ghostscript and ImageMagick with MacPorts. I don't follow the discussion in the link you supplied about doing the installation on an Enterprise server, but my system doesn't have anything like .../plugins/ImageMagick. The only difference I noted in the instructions was the order in which ghostscript and ImageMagick were installed - I think I did it the other way around; doing ghostscript first and then ImageMagick. This was following David's suggestion that ImageMagick needed to "know" about ghostscript when it was installed. Because this seems to be an IDL Mac-specific problem, I posted a query on the Exelis IDL forum. They were able to reproduce the problem, but have not come up with an explanation (or solution).

Barry
