I am familiar with setting environment variables in Mac, but am not certain if I am setting the correct ones. I followed the instructions on the install page below, setting MAGICK_HOME, PATH, and DYLD_LIBRARY_PATH, but that has not worked.

 http://www.imagemagick.org/script/binary-releases.php#macosx

Also, as a side note (and not really problem), after the errors are generated, cgSnapshot outputs the following message:

Output will be created here: /[directory]/test.bmp

but no output is generated.
