FWIW, here is an approach that combines the strings in the array, adding in a separator character that doesn't appear in the original string (in this example a '\'), and then splitting up the joined string at one or more periods or at the added separator character:

```
s = STRJOIN(aStringArr, '\')
result = STRSPLIT(s, '\.+\|\\', /REGEX, /EXTRACT)
```

I hope this helps,  
Jim (Exelis VIS)
