Hi - I'm just playing with some color tables and issued the following command:

```
TVLCT, cgColor('Green', /Triple), 4
```

and got the following message.

```
% TVRD: Unable to create X windows Window is iconified and has no backing store, nothing read.
```

This message is annoying, but seems to have no consequence as the color is indeed loaded at the correct place in the color table (as verified by using CIndex). What's happening?

I'm running IDL 8.2.3 on a Mac under OSX 10.8.5.

Thanks.
