Are you using something like VNC or NX to connect to a full desktop session on
the server? If yes, then your windows keyboard is forwarded "raw" to the linux
session. Use that session's settings tool to choose an azerty
keyboard, like you would on a local machine.

Or are you logging in with ssh/putty (you said "terminal")? I would not expect
that the linux side knows about your keyboard then, it should just get the
letters you type, no matter which key needed to be pressed to get it.

Does any of this makes sense to you?
