Subject: Writing an 8 Column array into a data file Posted by drewciampa on Sat, 15 Feb 2014 04:14:01 GMT View Forum Message <> Reply to Message

I'm trying to write a large array into a data file.

The array is 8 columns with up to 6000 rows. I have tried to do this using printf mainly. Now below you will see a main problem with one of the columns, but overall the 8 columns keep stacking. I can't seem to get 8 individual columns with 6000 rows, each column having the correct set of data. Instead I get 8 columns where the data is being written horizontally instead of vertically.

An even bigger problem I am having is trying to printf an array of hexadecimal values into a data file. The values '2b40e2200ff00007' are only showing up as ' 2' in the data file. It seems that the printf function is only writing the first digit. I've been using the 'Z' format code just FYI.

PS. the 8 column array was constructed from 8 separate arrays each containing 6000 values.

Thanks in advance
