
Subject: Problem with cgcmdwindow__define

Hi all (David),

I seem to be having a problem when saving a cgWindow to a Raster image file. I think the problem may be in cgcmdwindow__define. I am trying to save a cgWindow, to a PNG file (although this happens for any file type) however the outputted image is only a single pixel wide.

I believe this is because a WIDTH of 0 is being passed to cgPS_Close (line 2662 in cgcmdwindow__define) which comes from self.im_width. With the width set thus when an N_ELEMENTS check is done during cgPS_Close the program thinks I want to resize the image to something of width 0.

This fault seems to have only arisen recently.

Many thanks with any help you can provide,
Sean.
