---

I'm trying to use ASSOC to link a structure with a large file.

The structure consists of lonarr(48) followed by intarr(14423). This pattern being repeated 16036 times in the file.

I ASSOC the structure with the file (including 16252 byte offset for a file header)

The structure size should be 29038 bytes , but HELP,/STRUCT gives it as 29040.

I would accept the 2 byte difference as a structure ID or something. But the data values I'm getting are all wrong - suggesting that ASSOC is not mapping the structure onto the file correctly, or it's using the wrong structure size ?

Can anyone explain this anomaly.

I'm using DEC Unix 3.2 on an Alpha.

Thanks

Steve
