I want to know if there are any other ways of visualizing 3D array data
interactively as a volume in idl/PV-Wave other than rendering,shading and
displaying with t3d.

 The data is 35 slices of PET with 128 by 128 image size. It has
to be visualized with respect to a co-ordinate system to compare with
another volume set.

 Any suggestions or pointers are welcome.

thanks in advance,
Nagesh
