I am a recent Ph.D. graduate in medical image processing.
My research work was analysing the feasibility of interactive
Metz filter and an interactive adaptive filter using Free
Response Operating Characteristic (FROC) method, in the detection
of focal abnormalities on planar nuclear medicine bone scans.

I am an expert in 2D filter design, implementation and evaluation.
I have developed X Window GUI software with event handlers for my
Ph.D. work using IDL/PVWave Command Languages. I can write, test
and debug codes in C/C++.

I need a job within Canada as soon as possible.
