> Can't you just do F6 or hit the Step Over button instead?

well I made an example with the IDL function "mean" but often when I debug code I might want to step into the function I call to see if it's responsible of the problem.

```
function debugging_overload_mean, array
   return, mean(array)
end

pro debugging_overload
   h = hash('key', INDGEN(10))
   a = debugging_overload_mean(h['key']) ; breakpoint
end
```

Both F6 and F7 won't allow me to "follow" the content of the hash into the function. I guess that's what the "step-into" button is made for ;)

Thanks,

Fabien
