Hello,

I have created a netCDF file for my dataset using IDL. Now I wanted to create an XML file with meta data for the dataset. Is there a way I can create simultaneously an XML file when creating the netCDF file in the IDL code? In the XML file, I just need toe meta information , which is already present in the netCDF headers of my data. Also, each time when I make some changes the code shall create a new XML file.

Can anyone help me how I can include the lines for creating an XML file for the netCDF file?

Thanks in advance,
Madhavan
