Hi

I have the following expression:

value = 0

```
for i=0, 283 do begin  
  for j=0, 283 do begin  
    value = (value + (A[i,j]-B[i,j])^2.)/17000.  
  endfor  
endfor
```

when I type, print value I got the following error:

% Program caused arithmetic error: Floating underflow

Does anyone know why this happens?

Regards,  
Gina
