Hi

I have the following expression:

```
value = 0
```

```
for i=0, 283 do begin
  for j=0, 283 do begin
    value = (value + (A[i,j]-B[i,j])^2.)/17000.
  endfor
endfor
```

when I type, print value I got the following error:
% Program caused arithmetic error: Floating underflow

Does anyone know why this happens?

Regards,
Gina
