Hello folks,

I'm programming with IDL 8.2 and I have an issue with IDL_IDLBridge.

I use some IDL bridges to compute on large pictures.

In the code used by those bridges, the program executes a large loop. At some point in this loop, all the children stop with the abort command (status = 4). There aren't any type problem, I tested the function in the main IDL process but it doesn't create any problem.

Does anyone have an idea what's happening in the children processes?

Cheers,

Mathieu
